Dr. John Laidlaw  
Medical Research Council  
EEG Unit  
Western General Hospital  
Edinburgh, Scotland

Dear Dr. Laidlaw:

The recent Proceedings of the EEG Society of October 30, indicated your continued interest in quantitative measures of EEG. I recall your applications to changes with liver disease and would be grateful for any preprints which you may have available for other clinical applications. Your suggestion that the MDF is most sensitive in clinical correlation is of interest. In which studies in addition to the cardiac operations has this been true?

Many thanks.

Sincerely yours,

Max Fink, M.D.  
Professor of Psychiatry
