Dr. Ralph Smith
Mayo Clinic
Rochester, Minnesota

Dear Dr. Smith:

For some time we have been carrying out EEG analysis using a 24K IBM 1800. The studies are primarily psychopharmacological and we are now interested in adding EKG analysis to determine the changes that may be associated with high doses of psychoactive drugs.

We requested the assistance of IBM and they indicated that a program for EKG analysis is available for the 1800 at your Center. Is it possible to obtain the program and its documentation?

Many thanks.

Sincerely yours,

Max Fink, M.D.
Professor of Psychiatry
