230 Hilton Avenue
Hempstead, New York

Dear Bob:

I was very much surprised by your interesting article in the latest issue of the *International Journal of Neuropsychiatry*. The findings follow logically from the earlier studies by Shagass and from our own opinion that nystagmus is a behavioral concomitant of the EEG changes induced by barbiturate. You have shown that this parallelism is indeed useful in diagnosis.

I am indeed grateful that you did undertake such a definitive study. Would you be kind enough to send me a reprint when such is available?

Sincerely yours,

Max Fink, M.D.
Professor of Psychiatry
