Dr. Issai Lefkowitz
Clarksville Road
Princeton Junction, New Jersey

Dear Dr. Lefkowitz:

Within a week of the time that we discussed your interest in magnetism, the enclosed article appeared in the New York Times (May 6). Apparently Dr. Cohen has built the room you suggested. I am taking the liberty of sending you copies of the two articles and wonder if you could answer a question for me.

The electrical activity of the brain as recorded on the surface of the scalp is generally calibrated as varying between 50 and 150 microvolts in amplitude for leads which are approximately one centimeter across on their surface and separated over the scalp from two to five inches. Can Dr. Cohen's laboratory measure the changes in electrical activity from the brain.

Perhaps we will have an opportunity to continue our discussion.

Sincerely yours,

Max Fink, M.D.
Professor of Psychiatry
