5400 Arsenal Street  
St. Louis, Missouri 63139

Dear Turan:

We received the tape from Istanbul, and found it compatible with our tape system. We analyzed your "records" and the range of values looks much like the EEG playback.

Our difficulty is in identifying the "record" on the tape. For example, our first EEG on playback looks like neither of the two playbacks you sent. We have more 20-second epochs than your sample; the artifacts do not match, etc.

We will be pleased to analyze similar tapes, and can make available paper or card outputs, or some statistical analyses if the data are complete.

I am enclosing a summary outline of instruments we used in another study. This will give you one way of identifying the record on tape, so we can find the correct record for each subject.

My best for 1972.

Sincerely yours,

Max Fink, M.D.  
Professor of Psychiatry
