Dear Bill,

We would like to revise the protocol for the AHR-1900 study. We have failed to see behavioral or EEG effects at the dosages up to 200 mg/day for 10-14-days. For the next few subjects we will increase the daily dosages to 400 mg a day.

In order to accomplish this, may we have an additional supply of AHR-1900, 30 x 50 x 10 mg?

Sincerely yours,

Max Fink, M.D.  
Professor of Psychiatry
