Mr. Herman Weisman  
Sr. Clinical Associate  
Hoffmann-La Roche, Inc.  
Nutley, New Jersey

Dear Hank,

Following our discussions, I have revised the protocol for the ongoing study of the EEG profile of bromazepam (9 mg), diazepam (10 mg) and placebo, with blood samples drawn for assay of these substances and metabolites before and 30, 60 and 120 minutes after drug ingestion. A copy is enclosed for your review and files.

The study began on Thursday. In three sessions that we ran, we encountered no difficulties beyond the discomfort of the subjects at experiencing four withdrawals of blood. Should this become a problem, we may have to increase the 'bonus' paid at the end of each study.

My best regards.

Sincerely yours,

Max Fink, M.D.
