

F: Letter

March 12, 1976

John Exner, Ph.D.
11 Beaver Drive
Bayville, N.Y. 11709

Dear John,

I read the record of G. Tromontelli, age 47. It is an average amplitude, mixed frequency record without distinguishing features. Hyperventilation and sleep activation were not done.

In the absence of seizure activity or slow waves, it is not possible to support a diagnosis of a post-seizure state; nor are there distinguishing criteria for a drug effect.

I trust this is helpful.

Sincerely yours,

Max Fink, M.D.
Professor of Psychiatry
