Durham, North Carolina 27705

Dear Rich,

Each year, second year students at Stony Brook are given a course on Neuroscience, with some input from psychiatry. I am scheduled to give three lectures on "EEG and Psychiatry" on April 30/May 1-2. The students will have had lectures on CT, PET, and NMR scanning. I usually present figures from our pharmaco-EEG program and always a few slides about the slow wave changes induced by ECT.

I would like very much to show them examples of the same EEG changes with ECT using the multi-lead display which you are now collecting. Would it be possible to supply me, at my cost, with slides of a pre-ECT, post ECT 6 to 9, and any other example of a display from your work?

Many thanks and my best regards.

Sincerely yours,

Max Fink, M.D.
Professor of Psychiatry
