Dear Dick:

Reading reports of the work of Tennant on Darvon-N brought to my attention that the principal toxic effect of the compound may be in its seizure inducing propensity. Nowhere did I find evidence of CNS studies.

Should you wish or be able to assess Darvon-N for its withdrawal use, examination of the EEG records would provide an objective (and obvious) answer to the question.

I would be glad to cooperate in such a study.

My best regards.

Sincerely yours,

Max Fink, M. D.
Professor of Psychiatry
