Dr. Fritz A. Freyhan
St. Vincent's Hospital
153 West 11th Street
New York, New York 10011

Dear Fritz,

Enclosed is our report "d-Cycloserine Therapy of Psychosis by Symptom Provocation" for your consideration for *Comprehensive Psychiatry*. This has not yet been edited by Dr. Itil. We plan to go over this on Thursday and if there are any corrections these can be made out within the next two weeks, if the report is acceptable.

I am also enclosing an interim report "Acute EEG Effects of Heroin and Naloxone in Man". With the appropriate figures (which are now at the artist) and some corrections in the text, this could be prepared for publication by October 10.

After talking to you, I realized we have a third report which is being revised and may be of equal interest. This confirmation of a paper written by Pitts and McClure in the *New England Journal of Medicine* may be of even more interest to your readers.

Also enclosed are some notes from Dr. Donald Scott regarding a new device for monitoring EEG in patients in coma. He is using this in patients with cardiac arrest and it may interest you.

Sincerely yours,

Max Fink, M.D.
Professor of Psychiatry
